IN THE CLAIMS:

A complete listing of the claims is set forth below. Please amend the claims as

follows:

1. (Previously Presented) A method for solving a supply chain planning

problem, comprising the steps of:

decompositioning the supply chain planning problem into a plurality of

independent sub-problems;

forming a plurality of distributed sub-problem partitions, each of said distributed

sub-problem partitions including a plurality of related items and associated with a

respective independent sub-problem of said supply chain planning problem;

loading data into a plurality of distributed database partitions, said data

associated with said plurality of related items, and each of said distributed database

partitions associated with a respective one of each of said distributed sub-problem

partitions; and

solving each of said plurality of said independent sub-problems by separate

processes operating in parallel in a distributed database processing environment.

2. (Previously Presented) The method of Claim 1, further comprising the

steps of:

forming a plurality of clusters, each of said clusters including said plurality of

related items; and

forming said plurality of distributed sub-problem partitions from said plurality of

clusters.

3. (Previously Presented) The method of Claim 1, wherein the number of

distributed sub-problems and database partitions is equal to three.

4. (Original) The method of Claim 1, wherein said plurality of related items

are related by one or more pre-defined relationship rules.

Response to Final Office Action Attorney Docket No. 020431.0947 Serial No. 09/963,960 5. (Original) The method of Claim 2, wherein the step of forming said plurality of said clusters further comprises a step of assigning a CLUSTER_ID to each

item of said plurality of related items.

6. (Currently Amended) The method of Claim 2, wherein the step of forming

a plurality of distributed sub-problem partitions from said plurality of clusters further

comprises a step of equally sizing said distributed sub-problem partitions partitions as

close to equal as possible.

7. (Previously Presented) The method of Claim 1, wherein the step of

solving each of said plurality of said distributed sub-problems further comprises a step

of solving said plurality of independent sub-problems in parallel.

8. (Canceled)

9. (Previously Presented) A method for solving a supply chain planning

problem, comprising the steps of:

decompositioning the supply chain planning problem into a plurality of

independent sub-problems;

storing data associated with at least one new item in a temporary database

location;

forming at least one cluster, said at least one cluster including said data

associated with said at least one item;

merging said at least one cluster with at least one cluster associated with at least

one distributed sub-problem partition;

loading said data into at least one distributed database partition, said at least one

distributed database partition associated with said at least one distributed sub-problem

partition; and

solving said at least one independent sub-problem by separate processes

operating in parallel in a distributed database processing environment.

Response to Final Office Action Attorney Docket No. 020431.0947 Serial No. 09/963,960 10. (Previously Presented) A system for solving a supply chain planning

problem, comprising:

a plurality of independent sub-problems decomposed from the supply chain

planning problem;

a database, said database including a plurality of distributed partitions, each

partition of said plurality of distributed partitions associated with a respective

independent sub-problem of said supply chain planning problem; and

at least one processor operating in a distributed database processing

environment, the at least one processor associated with a respective partition of said

plurality of distributed partitions, and collectively operable to:

form a plurality of distributed sub-problem partitions, each of said

distributed sub-problem partitions including a plurality of related items and associated

with a respective independent sub-problem of said supply chain planning problem;

load data into a plurality of distributed database partitions, said data

associated with said plurality of related items, and each of said distributed database

partitions associated with a respective one of each of said distributed sub-problem

partitions; and

solve said plurality of said independent sub-problems by separate

processes operating in parallel in the distributed database processing environment.

11. (Previously Presented) The system of Claim 10, further operable to:

form a plurality of clusters, each of said clusters including said plurality of related

items; and

form said plurality of distributed sub-problem partitions from said plurality of

clusters.

12. (Previously Presented) The system of Claim 10, wherein the number of

distributed sub-problems and database partitions is equal to three.

13. (Original) The system of Claim 10, wherein said plurality of related items

are related by one or more pre-defined relationship rules.

14. **(Previously Presented)** The system of Claim 11, wherein said at least one processor is further operable to:

assign a CLUSTER_ID to each item of said plurality of related items.

15. (Currently Amended) The system of Claim 10, wherein said at least one processor is further operable to:

equally size said distributed sub-problem <u>partitions</u>. partitions as close to equal as possible.

16. **(Previously Presented)** The system of Claim 10, wherein said at least one processor is further operable to:

solve said plurality of independent sub-problems in parallel.

17. (Canceled)

18. (Previously Presented) A system for solving a supply chain planning

problem, comprising:

a plurality of independent sub-problems decomposed from the supply chain

planning problem;

a database, said database comprising a plurality of distributed partitions and a

temporary storage location, each partition of said plurality of distributed partitions

associated with a respective independent sub-problem of said supply chain planning

problem; and

at least one processor operating in a distributed database processing

environment, the at least one processor associated with a respective partition of said

plurality of distributed partitions, and collectively operable to:

store data associated with at least one new item in the temporary

database location;

form at least one cluster, said at least one cluster including said data

associated with said at least one item:

merge said at least one cluster with at least one cluster associated with at

least one distributed sub-problem partition;

load said data into at least one distributed database partition, said at least

one distributed database partition associated with said at least one distributed sub-

problem partition; and

solve said at least one independent sub-problem by separate processes

operating in parallel in a distributed database processing environment.

19. (Previously Presented) Software for solving a supply chain planning

problem, the software being embodied in computer-readable media and when executed

operable to:

decompose the supply chain planning problem into a plurality of independent

sub-problems;

form a plurality of distributed sub-problem partitions, each of said distributed sub-

problem partitions including a plurality of related items and associated with a respective

independent sub-problem of said supply chain planning problem;

load data into a plurality of distributed database partitions, said data associated

with said plurality of related items, and each of said distributed database partitions

associated with a respective one of each of said distributed sub-problem partitions; and

solve each of said plurality of said independent sub-problems by separate

processes operating in parallel in a distributed database processing environment.

20. (Previously Presented) The software of Claim 19, when executed further

operable to:

form a plurality of clusters, each of said clusters including said plurality of related

items; and

form said plurality of distributed sub-problem partitions from said plurality of

clusters.

21. (Previously Presented) The software of Claim 19, wherein the number of

distributed sub-problems and database partitions is equal to three.

22. (Original) The software of Claim 19, wherein said plurality of related items

are related by one or more pre-defined relationship rules.

23. (Original) The software of Claim 20, wherein forming said plurality of said

clusters further comprises assigning a CLUSTER_ID to each item of said plurality of

related items.

Response to Final Office Action Attorney Docket No. 020431.0947 Serial No. 09/963,960 Page 8

- 24. **(Currently Amended)** The software of Claim 20, wherein forming a plurality of distributed sub-problem partitions from said plurality of clusters further comprises <u>equally</u> sizing said distributed sub-problem <u>partitions</u>. <u>partitions</u> as close to equal as possible.
- 25. (Previously Presented) The software of Claim 19, wherein solving each of said plurality of said distributed sub-problems further comprises solving said plurality of distributed sub-problems in parallel.
 - 26. (Canceled)

27. (Previously Presented) Software for solving a supply chain planning

problem, the software being embodied in computer-readable media and when executed

operable to:

decompose the supply chain planning problem into a plurality of independent

sub-problems;

store data associated with at least one new item in a temporary database

location;

form at least one cluster, said at least one cluster including said data associated

with said at least one item;

merge said at least one cluster with at least one cluster associated with at least

one distributed sub-problem partition;

load said data into at least one distributed database partition, said at least one

distributed database partition associated with said at least one distributed sub-problem

partition; and

solve said at least one independent sub-problem by separate processes

operating in parallel in a distributed database processing environment.
